

This code defines a Java configuration class for setting up test configurations for a Spring MVC application.

- **@Configuration** annotation indicates that this is a Java configuration class for the Spring application context.
- **@ComponentScan** is used to specify the base package for component scanning.
- **@EnableWebMvc** is used to enable Spring MVC support.
- **public ObjectMapper objectMapper()** is a method that creates and returns an instance of the **ObjectMapper** class, which is a part of the Jackson JSON processing library, and is used for serialization and deserialization of Java objects to and from JSON.
- This configuration is used to setup test configuration for the Spring MVC application.
